

AUTO TICKET CLASSIFICATION

Customer Journey Map — ServiceNow Flow Designer

JOURNEY	ENTICE Awareness / Trigger	ENTER Create Ticket	ENGAGE Classify & Route	EXIT Resolution / Closure	EXTEND Feedback & Learning
Steps	A user realizes an IT issue or needs a service.	User opens ServiceNow and creates an incident/request.	Ticket is automatically evaluated by Flow Designer and classified.	Support team works the ticket, updates status, and resolves it.	User receives closure information and can provide feedback.
Interactions	Employee, team lead, or support guidance; ServiceNow portal is identified as the channel.	ServiceNow form; short description, description, category-related details, and submission.	Flow Designer trigger, conditions, classification fields, assignment group, and automated routing.	Assigned support group, ServiceNow work notes, status updates, notifications, and resolution details.	Resolution notification, ServiceNow ticket history, feedback/review mechanism, and support follow-up.
Goals & motivations	Help me report my issue clearly and get the right support.	Help me submit the ticket quickly without confusion.	Help me avoid manual routing delays and get my ticket to the right team.	Help me get my issue resolved and know who owns it.	Help me understand what was done and share feedback if needed.
Positive moments	The user knows where to report the issue.	Ticket submission is straightforward and the request is captured.	Classification and assignment happen automatically and consistently.	The ticket has clear ownership and the user can track progress.	The user gets closure information and can contribute feedback.
Negative moments	User may be unsure which ticket type or information is needed.	Incomplete or unclear descriptions may make manual handling harder.	Incorrect conditions or missing mappings could route a ticket incorrectly.	Delays can occur if the assigned team needs clarification or reassignment.	Users may not provide feedback or may be unclear about next steps after closure.
Areas of opportunity	Provide clear incident/request guidance and examples at ticket creation.	Use mandatory/validated fields and simple form guidance to improve input quality.	Expand classification conditions and assignment mappings; add exception handling.	Add status notifications, escalation rules, and clear ownership visibility.	Use feedback to identify misclassifications and improve Flow Designer rules.
