

Project Design Phase-II

Data Flow Diagram & User Stories

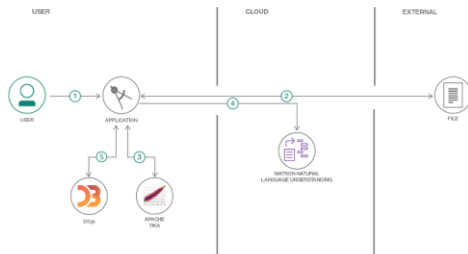

Date	01/10/2026
Team ID	SWTID-2026-2467
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

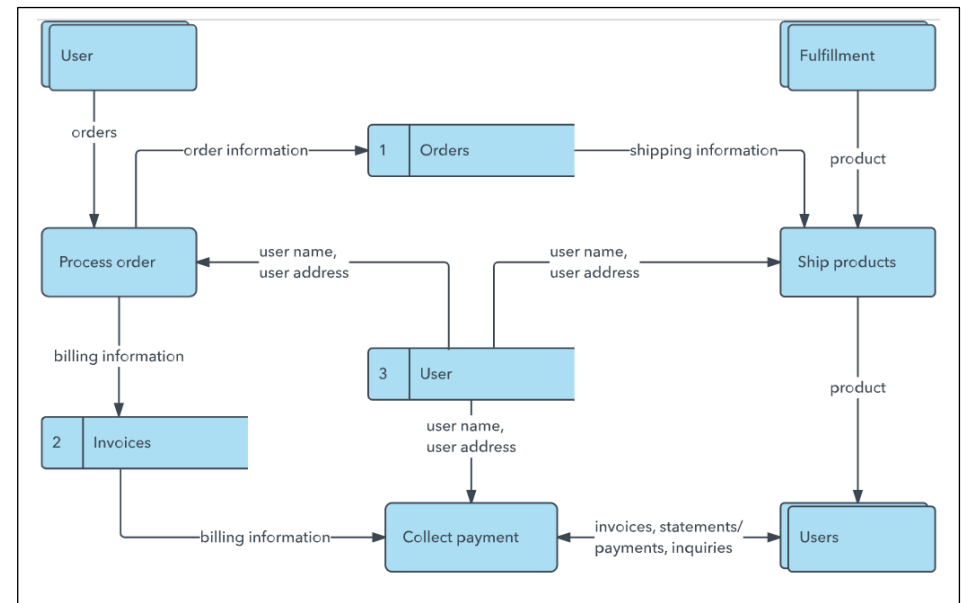

Example: (Simplified)

Flow

1. User configures credentials for the Watson Natural Language Understanding service and starts the app.
2. User selects data file to process and load.
3. Apache Tika extracts text from the data file.
4. Extracted text is passed to Watson NLU for enrichment.
5. Enriched data is visualized in the UI using the D3.js library.

Example: DFD Level 0 (Industry Standard)

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Employee / Requester	Ticket Creation	USN-1	As an employee, I can create an incident or service request in ServiceNow with the required ticket details.	Ticket is created successfully and the required ticket information is stored.	High	Sprint-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Employee / Requester	Ticket Tracking	USN-2	As an employee, I can view the status and assignment of my submitted ticket.	I can see the current ticket status and assigned support group when available.	High	Sprint-1
Service Desk Agent	Auto Classification	USN-3	As a Service Desk agent, I want newly created tickets to be automatically classified using Flow Designer conditions.	The Flow is triggered on ticket creation/update and the configured classification fields are populated correctly.	High	Sprint-1
Service Desk Agent	Auto Assignment	USN-4	As a Service Desk agent, I want classified tickets to be automatically routed to the appropriate assignment group.	The ticket is assigned to the configured support group when the routing condition is satisfied.	High	Sprint-1
Service Desk Agent	Exception Handling	USN-5	As a Service Desk agent, I can manually review a ticket when no classification or routing rule matches.	Unmatched tickets remain available for manual review and are not incorrectly routed.	Medium	Sprint-2
ServiceNow Administrator	Rule Management	USN-6	As an administrator, I can maintain classification conditions and assignment mappings as business requirements change.	Updated rules can be configured and used by the Flow without changing the overall process design.	Medium	Sprint-2
ServiceNow Administrator	Flow Monitoring	USN-7	As an administrator, I can monitor Flow execution and identify failed or incomplete automation runs.	Flow execution details are available for troubleshooting and failed processing can be identified.	Medium	Sprint-2
Employee / Requester	Resolution	USN-8	As an employee, I receive the ticket resolution/status update after the support team completes the request.	The ticket contains the final status/resolution information and the user can view the update.	High	Sprint-2
