

Project Design Phase Solution Architecture

Date	01/10/2026
Team ID	SWTID-2026-2467
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Example - Solution Architecture Diagram:

The proposed architecture uses ServiceNow Flow Designer to automate ticket classification and routing. When an incident or request is created or updated, the Flow reads the ticket information, evaluates predefined classification and assignment conditions, updates the relevant fields, and routes the ticket to the appropriate support group.

AUTO TICKET CLASSIFICATION

Solution Architecture — ServiceNow Flow Designer

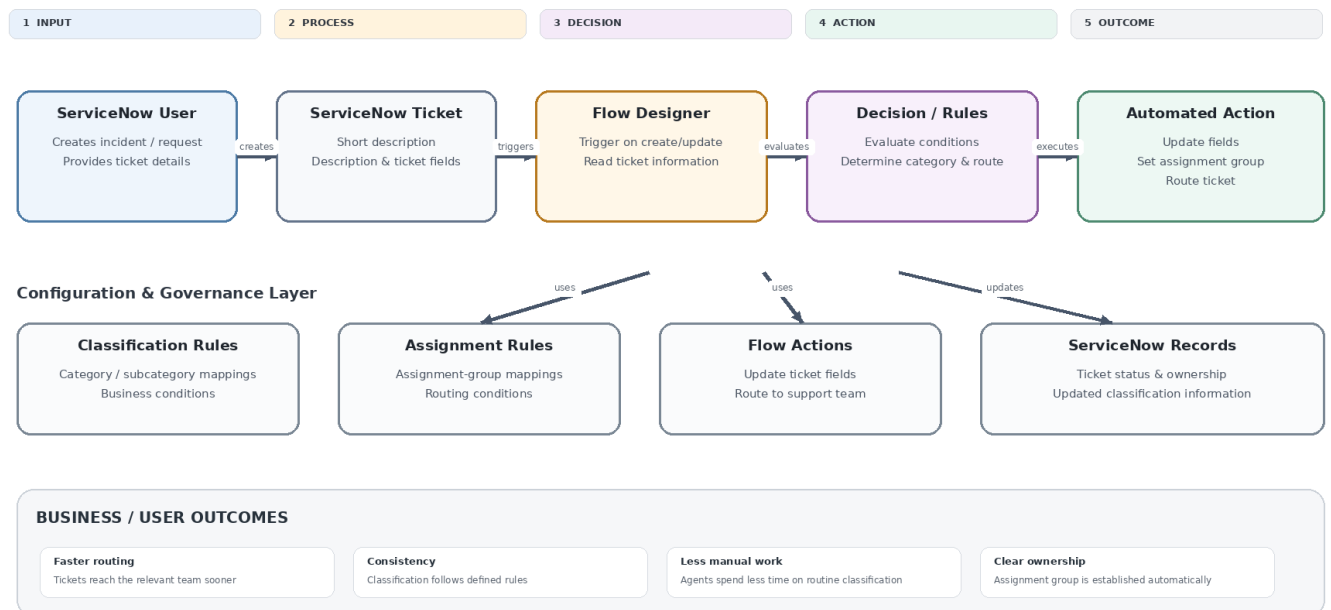

Figure 1: Solution architecture and data flow — Auto Ticket Classification using Flow Designer

Architecture note: The classification and routing logic is represented as predefined Flow Designer conditions and actions. Specific fields, categories, assignment groups, and trigger conditions can be configured according to the project's ServiceNow instance.
