

Functional & Performance Testing

Model Performance Test

Date	01 /10/26
Team ID	SWTID-2026-2467
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	10 Marks

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail	Screenshot
FT-01	Ticket Form Field Validation	Open the Incident Workflow form and verify the configured ticket fields.	Verify Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned to are available.	The Incident Workflow form contains the configured fields.	Pass	
FT-02	Category and Subcategory Configuration	Open the Subcategory configuration and review the dependent field and choices.	Subcategory choices should depend on Category and contain the configured mappings.	Subcategory is configured as dependent on Category; the configured choices are visible.	Pass	
FT-03	Ticket Classification Flow Logic	Open the Auto Classify School IT Tickets flow and review its trigger and conditional branches.	The flow should trigger for a new record with Category blank and evaluate classification conditions.	The flow shows the record-created trigger with Category null and conditional branches for Wi-Fi/Network, Projector/Hardware, Forgot password and Performance, followed by Update Record actions.	Pass	
FT-04	Classification Mapping Coverage	Review the configured classification mappings in the Subcategory choice list.	Configured mappings should include Projector-Hardware, Wi-Fi-Network, Slow Computer-Performance and Forgot Password-Access.	All four configured mappings are displayed in the choice list.	Pass	
FT-05	Record Update Action	Review the flow actions associated with the classification branches.	Each classification branch should contain an update action for the Incident Workflow record.	Update Incident Workflow Record actions are visible in the flow.	Pass	
PT-01	Flow Processing Design Check	Review the flow structure for conditional processing and record updates.	The flow should use conditional branches and update actions without unnecessary processing steps.	The configured flow uses conditional branches followed by Update Record actions. Runtime response time was not measured in the supplied evidence.	Pass	
PT-02	Repeated Ticket Processing Design Check	Review whether the flow is triggered from the Incident Workflow record and can process matching classification conditions.	The trigger and conditional logic should support processing of newly created tickets.	The flow is configured on Incident Workflow record creation and contains multiple classification branches. A load-test execution count was not captured.	Pass	
PT-03	Configuration Consistency Check	Compare the Flow Designer classification conditions with the configured Category/Subcategory choices.	Flow conditions and available choices should represent the same classification categories.	The screenshots show matching classification concepts across the flow and the configured choices: Wi-Fi/Network, Projector/Hardware, Forgot Password/Access and Performance/Slow Computer.	Pass	

Testing note: The supplied reference includes generic API, content-generation and file-upload tests. Those scenarios were adapted to the ServiceNow Flow Designer implementation. No API response-time, file-upload load, or fabricated execution-time value has been reported because the supplied project evidence does not contain such measurements.
