

Project Development Phase

Model Performance Test

Date	01/10/2026
Team ID	SWTID-2026-2467
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	10 Marks

Model Performance Testing:

This reference is designed for a machine-learning model. The submitted project is implemented using ServiceNow Flow Designer rule-based classification, so ML regression/classification metrics and hyperparameter tuning are not used. The corresponding fields below are adapted to document the actual classification logic and its validation method without inventing ML results.

S.No.	Parameter	Values	Screenshot
1	Metrics	Regression Model: Not used – this project does not perform regression. Classification Model: Rule-based Flow Designer classification. MAE / MSE / RMSE / R²: Not applicable. Confusion Matrix: Not generated because no ML classifier is trained. Accuracy Score: Not reported as ML accuracy; instead, the configured classification rules are validated against the four implemented mappings. Classification evidence: Wi-Fi → Network; Projector → Hardware; Forgot Password → Access; Slow Computer → Performance.	 Actual ServiceNow evidence
2	Tune the Model	Hyperparameter Tuning: Not applicable – no machine-learning model or trainable parameters are used. Configuration refinement performed: Category/Subcategory dependency and rule conditions were configured for the supported ticket types.	 Actual ServiceNow evidence
3	Validation Method	Rule-based functional validation. The configured Flow Designer conditions are checked against the corresponding Category/Subcategory mappings. The validation evidence covers the four configured ticket classifications and the Subcategory dependency on Category.	 Actual ServiceNow evidence
