

Project Development Phase

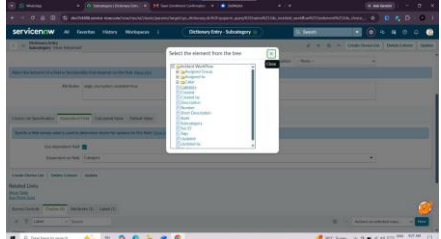

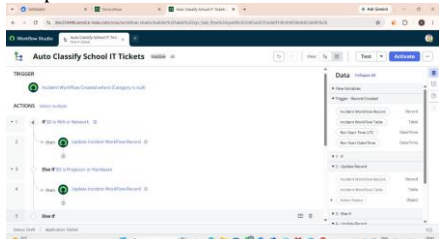

Performance Test

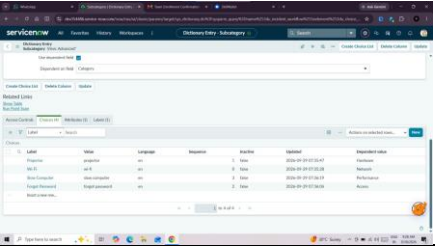

Date	01 /10/26
Team ID	SWTID-2026-2467
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	10 Marks

Model Performance Testing:

The supplied Tableau reference contains six performance-test parameters. The same structure is retained and adapted to the ServiceNow project. Only project-relevant evidence is included; Tableau-specific dashboard/story claims are not invented.

Screenshot verification: Data Rendered uses the Incident Workflow form; Data Preprocessing uses the Category/Subcategory dependency configuration; Utilization of Filters uses the Flow Designer conditions; Calculation Fields Used uses the configured category/subcategory mapping; Dashboard Design and Story Design are marked not applicable because this project does not use Tableau dashboards or Tableau stories.

S.No.	Parameter	Screenshot / Values
1	Data Rendered	The Incident Workflow form renders the ticket fields used by the automation, including Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned to. 
2	Data Preprocessing	The ServiceNow configuration establishes Subcategory as dependent on Category. This supports controlled selection of valid subcategories before/while ticket classification is applied. 
3	Utilization of Filters	Flow Designer conditions act as the filtering logic for classification. The flow checks the relevant ticket information and branches for Wi-Fi/Network, Projector/Hardware, Forgot Password/Access and Performance/Slow Computer. 
4	Calculation fields Used	No Tableau calculated fields or formulas are used. Instead, the project uses configured

		Category/Subcategory classification mappings and Update Record actions to set the ticket classification. 
5	Dashboard design – No of Visualizations / Graphs	-
6	Story Design – No of Visualizations / Graphs	-
